

EasyPeasy Component Copy

Open the Window

Go to Tools → Advanced Component Copy (Enhanced).

The main window shows a Sources panel, a Targets panel, and Theming options.

Add Sources

Drag & drop objects into the Source Objects section or click “Add Selected as Sources.”

Toggle “Copy Children?” if you want to replicate entire child hierarchies.

Expand each source object to select/deselect individual components (and optionally “Show Fields” for detailed field control).

Add Targets

In Target Objects, again drag & drop or click “Add Selected as Targets.”

For each target, optionally enable “Clear Before Paste?” to remove all existing components first.

“Auto Overwrite All Conflicts?” can globally skip prompts if a target already has the same component type.

Search & Filter

Each panel has a search bar (object name or partial component name).

Searching can use partial, exact, or regex. “-myTerm” inverts the search.

Items that don’t match are hidden, so you only see relevant data.

Customization

Expand “Customization / Theming.”

Adjust colors, fonts, banner icon name (e.g. "Clipboard"), and icon size.

Press “Save Theme Settings” to store them in EditorPrefs for future sessions.

Preview Copy (“Dry Run”)

Click “Preview Copy (Dry Run)” to generate an advanced summary: new vs. overwritten components, changed fields, warnings, etc.

Optionally export that summary to a .txt file.

Perform Copy

If all looks good, click “Perform Copy.”

The tool replicates components from your sources to your targets, removing or merging as per your toggles.
