

Tonic Post Processing - Documentation

Overview

Tonic Post Processing is a high-quality, performant image effect framework built specifically for the Built-in Render Pipeline (BiRP) in Unity. It does not rely on Post Processing Stack v2 and is designed to offer complete control and customization. The system is modular, easy to extend, and suitable for both stylized and realistic visual styles.

Key Features

- Built for Built-in Render Pipeline (BiRP)
- 8 high-performance post-processing effects:
 - * Bloom
 - * SSAO (Screen Space Ambient Occlusion)
 - * Motion Blur
 - * Sharpness
 - * Vignette
 - * Filmic Tonemapping & LUT grading
 - * Noise
 - * Lens Effects (Distortion, Chromatic Aberration)
- 4 Anti-Aliasing modes: FXAA, NFAA, DLAA, SSAA
- Built-in tools to manage and apply effects

Getting Started

To apply post-processing:

1. Navigate to Tools > TonicPostProcessing > Add Post Processing.
2. The tool will automatically find the Main Camera or create one if it does not exist.
3. It will attach the TonicPostProcessing component.
4. From the Inspector, click 'Add Effect' to select and activate any effect.
5. Adjust parameters in real-time to suit your scene style.

There is also an 'About' section available under Tools > About to verify system requirements and versioning.

Tonic Post Processing - Documentation

Compatibility & Requirements

- Unity 2022.3 or newer (Recommended: Unity 6+)
- HDR enabled on the main camera
- Linear color space
- Built-in Render Pipeline only
